

Katana Agent — Paytm RRN Capture

User & setup guide for the Android forwarder agent (package `shop.glhouse.agent`) · v2.8

1. What it does

Every payment into your Paytm Business account is captured on your Katana dashboard the moment it lands — payer, amount, and Order ID. The one thing Paytm never puts in a notification, SMS, or email is the **RRN** (the 12-digit UPI reference). It exists only on the Paytm app's transaction-detail screen, and it is shown *masked* there (e.g. `618...387144`).

The Katana Agent reads that RRN automatically and sends it to your dashboard, so each payment row shows its full RRN instead of “no RRN”.

2. How it works

Payment arrives → Paytm posts a “Payment received” notification → the agent **taps the notification** (which opens that exact transaction) → it taps the RRN’s “**Copy**” button → reads the full RRN off the clipboard → sends it to `glhouse.shop`, where it merges onto the payment row.

All of this is hands-free once set up. Typical time from payment to RRN on the dashboard: **about 5–10 seconds**.

3. What you need

- An Android phone with the **Paytm for Business** app, logged into the merchant account.
- The Katana Agent APK: **download from** `https://glhouse.shop/katana-agent.apk`
- Your **merchant code** (e.g. `MTCI-01`).
- Recommended: a **dedicated phone** kept on charge, so capture runs undisturbed.

4. Install

1. On the phone, open `https://glhouse.shop/katana-agent.apk` in the browser and download it.
2. Open the downloaded file → allow “Install unknown apps” if prompted → **Install**.
3. Updates install over the top (same signing key) — no need to uninstall first.

5. First-time setup (grant these permissions)

Open the **Katana Agent** app and enter your **merchant code**, then grant all of the following. Each is a one-time step.

Permission	Where	Why
Accessibility	Settings → Accessibility → Katana Agent → On	Reads the transaction screen & taps “Copy”
Notification access	Settings → Notifications → Notification access	Detects each incoming payment
Display over other apps	Settings → Apps → Special access	Lets it read the RRN off the clipboard
Battery — no restrictions	App info → Battery → Unrestricted	Stops the phone from killing it

Shizuku (optional, recommended)	Install Shizuku app + grant the agent	Makes taps reliable on Paytm
--	---------------------------------------	------------------------------

ColorOS / OnePlus / Oppo / Realme note: on Android 13+, first open **App info** → ⋮ (top-right) → **Allow restricted settings** before the Accessibility toggle will stay on.

6. Verify it's working

1. Take one test payment into the Paytm Business account (any small amount).
2. Within ~10 seconds, open your Katana dashboard for the merchant — the payment row should now show its **RRN** instead of “no RRN”.
3. Inside the Katana Agent app, the **live log** shows the capture trail: `tapped credit notif` → `tap Copy` → `clipboard RRN...` → `✓ sent`.

7. Everyday use

- Leave the phone on and charged. The agent runs in the background — you don't need to open anything.
- On a dedicated device, you can leave Paytm Business open on the payments list for maximum reliability.
- Payments and RRNs appear on the dashboard on their own; no manual refresh needed.

8. Troubleshooting

RRNs stopped appearing after a Paytm update

Paytm/ColorOS updates can silently switch the **Accessibility (screen reader)** off. Re-open Settings → Accessibility → Katana Agent, toggle it **Off then On**. Re-check “Display over other apps” too.

RRNs stopped after a reboot

If using Shizuku, it must be re-started after each reboot (Shizuku app → start via wireless debugging). Then re-grant the agent if asked.

Payment shows but still “no RRN”

Open that transaction in Paytm Business once — the agent captures it on view. If it persists, confirm all five permissions above are still granted.

9. Good to know (limits)

- RRN capture takes **~5–10 s per payment** (Paytm's screen render is the slow part).
- During a burst of payments in the same minute, RRNs fill in one after another over the following minute — none are lost, they just trickle in.
- The payment itself (amount/payer) is always on the dashboard instantly; only the RRN has this short delay.
